## Show all installed packages or software in Linux, FreeBSD, OpenBSD

Posted by [Vivek Gite](#) <[vivek@nixcraft.com](mailto:vivek@nixcraft.com)>

Q. I am using CentOS how do I show all installed packages in Linux?

A. You need to use rpm command to display all installed packages in Linux.

### Red Hat/Fedora Core/CentOS Linux

Type the following command to get list of all installed software

```
# rpm -qa | less
```

### Debian Linux

Type the following command to get list of all installed software:

```
# dpkg --get-selections
```

### Ubuntu Linux

Type the following command to get list of all installed software:

```
# sudo dpkg --get-selections
```

### FreeBSD

Type the following command to get list of all installed software:

```
# pkg_info | less  
# pkg_info apache
```

Use pkg\_version command to summarizes the versions of all installed packages:

```
# pkg_version | less  
# pkg_version | grep 'lsof'
```

### OpenBSD

OpenBSD also use pkg\_info command to display list of all installed packages or software:

```
# pkg_info | less  
# pkg_info apache
```
