## How do I test php installation with a phpinfo page?

Posted by [Vivek Gite](#) <[vivek@nixcraft.com](mailto:vivek@nixcraft.com)>

PHP has a special function called phpinfo. It displays a large amount of information about the current state of PHP. This includes information about PHP compilation options and extensions, the PHP version, server information and environment, OS version information, paths, master and local values of configuration options, HTTP headers, and the PHP License etc.

Create following test.php script in /var/www/html directory (or your httpdoc directory):

```
<?
phpinfo();
?>
```

Open your web browser and type url: <http://domain.com/test.php>. For more information see [official phpinfo](#) <sup>[1]</sup> documentation.
