How To Use grep Command In Linux / UNIX

Posted by [Vivek Gite](#) <vivek@nixcraft.com>

How do I use grep command in Linux?

grep command searches the given file for lines containing a match to the given strings or words. By default, grep prints the matching lines. Use grep to search for lines of text that match one or many regular expressions, and outputs only the matching lines.

The name, "grep", derives from the command used to perform a similar operation, using the Unix/Linux text editor ed:
g/re/p

UNIX

[2]

grep command syntax

```
grep 'word' filename
grep 'string1 string2' filename
cat otherfile | grep 'something'
command | grep 'something'
```

Use grep to search file

Search /etc/passwd for boo user:

```
$ grep boo /etc/passwd
```

You can force grep to ignore word case i.e match boo, Boo, BOO and all other combination with -i option:

```
$ grep -i "boo" /etc/passwd
```

Use grep recursively

You can search recursively i.e. read all files under each directory for a string "192.168.1.5"

```
$ grep -r "192.168.1.5" /etc/
```

Use grep to search words only

When you search for boo, grep will match foofoo, boo123, etc. You can force grep to select only those lines containing matches that form whole words i.e. match only boo word:

```
$ grep -w "boo" /path/to/file
```

Use grep to search 2 different words

use egrep as follows:

```
$ egrep -w 'word1|word2' /path/to/file
```

Count line when words has been matched

grep can report the number of times that the pattern has been matched for each file using -c (count) option:

```
$ grep -c 'word' /path/to/file
```

Also note that you can use `-n` option, which causes `grep` to precede each line of output with the number of the line in the text file from which it was obtained:

```
$ grep -n 'word' /path/to/file
```

Grep invert match

You can use `-v` option to print inverts the match; that is, it matches only those lines that do not contain the given word. For example print all line that do not contain the word `bar`:

```
$ grep -v bar /path/to/file
```

UNIX / Linux pipes and grep command

`grep` command often used with pipes. For example print name of hard disk devices:

```
# dmesg | egrep '(s|h)d[a-z]'
```

Display cpu model name:

```
# cat /proc/cpuinfo | grep -i 'Model'
```

However, above command can be also used as follows without shell pipe:

```
# grep -i 'Model' /proc/cpuinfo
```

How do I list just the names of matching files?

Use the `-l` option to list file name whose contents mention `main()`:

```
$ grep -l 'main' *.c
```

Finally, you can force `grep` to display output in colors:

```
$ grep --color vivek /etc/passwd
```
