Find running kernel version 2

Task: Install Kernel source and headers for Redhat Enterprise Linux or CentOS Linux 2

Task: Download Kernel source code for running kernel 2

[Home](#) > [Faq](#) > [CentOS](#)

You need to have the Linux kernel source installed for this driver

Posted by [Vivek Gite](#) <vivek@nixcraft.com>

Q. When I try to compile and install a driver downloaded from other website I get the error message:

You need to have the linux kernel source installed for this driver

How do I fix this problem and how do I install Linux kernel source code?

A. You need to install kernel source code and most important kernel headers in order to compile a driver or module.

The kernel headers are necessary if you require to install a driver for Nvidia, ndiswrapper, Cisco VPN, Vmware, Wireless card and many other drivers. If a driver requires kernel sources, it may be sufficient to install only the kernel headers.

Find running kernel version

First find out running kernel version, by typing:

```
$ uname -r
```

Output:

```
2.6.20-15-generic
```

Task: Install Kernel source and headers for **Redhat** Enterprise Linux or **CentOS** Linux

Use command to install both kernel source code and headers, enter:

```
# up2date kernel-source kernel-devel
```

If you are using RHEL/CentOS 5 or Fedora core, try:

```
# yum install kernel-source kernel-devel
```

Task: Download **Kernel source code** for running kernel

You can visit official [Linux kernel](#) ^[2] website and install source code
