## Explain: php\_self or \$\_SERVER['PHP\_SELF'] Usage

Posted by [Vivek Gite](#) <[vivek@nixcraft.com](mailto:vivek@nixcraft.com)>

Can you explain usage of predefined variables called \$\_SERVER['PHP\_SELF']?

PHP programming language provides a lots of predefined variables. Your php script can access a large number of such predefined variables.

### \$\_SERVER array

\$\_SERVER is an array defined in PHP and it stores information about your server and execution environment information.

#### \$\_SERVER['PHP\_SELF'] variable

This array element points out the filename of the currently executing script. For example, if you run [www.cyberciti.biz/index.php](http://www.cyberciti.biz/index.php), \$\_SERVER['PHP\_SELF'] would be /index.php. This is relative to the document root. This is useful to referring HTML forms and other element.

```
....
<div class="forumform">
<form action="" . $_SERVER['PHP_SELF'] . " method="post" onSubmit="return checkForm()" name='
....
```
