How do I remotely administer a Windows server running IIS 6.0 web server from a Windows XP Professional desktop system?

Posted by [Vivek Gite](#) <vivek@nixcraft.com>

MS [Internet Information Services](#) ^[2] (IIS) is a set of Internet-based services such as NTP, FTP, HTTP/HTTPS, SMTP, NNTP etc. It is the world's second most used web server (number one is Apache Web server).

You need to use IIS 6.0 Manager for Windows XP. With IIS 6.0 Manager for Windows XP, administrators can remotely manage an IIS 6.0 server from a Windows XP Professional desktop computer system.

According to Microsoft documentation, "With IIS 6.0 Manager for Windows XP, administrators can remotely manage an IIS 6.0 server from a Windows XP Professional workstation. This tool only installs a snap-in for Microsoft Management Console and its associated DLLs and documentation; it does not install the complete IIS 6.0 server on your local computer"

You can [download](#) ^[3] (3.7 MB) Internet Information Services (IIS) 6.0 Manager for Windows XP from Microsoft web site.
