Reboot UNIX System Command

Posted by [Vivek Gite](#) <vivek@nixcraft.com>

Q. How do I reboot a UNIX system computer?

A. To reboot UNIX system type the following command at a shell prompt. To restart the operating system, enter:

shutdown -y -i6 -g120 "* Rebooting Server kernel upgrade ***"**

OR

reboot

First, command will warn all users logged in of the impending loss of service. In this example message is "*** Rebooting Server kernel upgrade ***". The -g120 is nothing but grace period, which allow the super user to change the number of seconds from the 60-second default. If you do not wish to provide warning and would like to reboot immediately, enter:

```
shutdown -y -i6 -g
```

The word "UNIX" is written in a large, bold, red, sans-serif font.
