## Add a package group using up2date command

Posted by [Vivek Gite](#) <[vivek@nixcraft.com](mailto:vivek@nixcraft.com)>

Q. How can I add a package group using up2date command?

A. Update Agent provides a complete system for updating the RPM packages installed on a Red Hat Enterprise Linux system. Both command line and graphical interfaces are included.

### Task: Install group package

For example install all Development Tools package i.e. gcc c/c++ compiler and related libs:

Login as root and type the following command:

```
# up2date -i "@ Development Tools"
```

### Task: List group packages

```
# up2date --show-groups | more
```

Read man page of up2date for more information. Please note that above command only works with RHEL version 4.0.
