## Solaris Buffer Overflow Protection

Posted by [Vivek Gite](#) <[vivek@nixcraft.com](mailto:vivek@nixcraft.com)>

One of the most common ways for hackers to break into a Solaris system is to exploit buffer overflows. How do I turn on buffer overflow protection under Solaris UNIX operating system just like [CentOS/Redhat Linux](#) <sup>[2]</sup> system?

Sun Solaris UNIX kernel provide protection against buffer overflows. It can detect, log, and prevent such attempts to execute code on the stack. You need update the /etc/system file, which provides a static mechanism for adjusting the values of kernel parameters. Values specified in this file are read at boot time and are applied. Any changes that are made to the file are not applied to the operating system until the system is rebooted.

Open /etc/system file, enter:

```
# cp /etc/system /etc/system.old
# vi /etc/system
```

Add / modify the following lines:

```
set noexec_user_stack=1
set noexec_user_stack_log=1
```

Where,

- **noexec\_user\_stack=1** : Turn on buffer overflow protection
- **set noexec\_user\_stack\_log=1** : Enable the Logging of Executable Stack Messages.

Finally, reboot the system:

```
# init 6
```
