## Monitor Linux user activity in real time

Posted by [Vivek Gite](#) <[vivek@nixcraft.com](mailto:vivek@nixcraft.com)>

[1]

**Q.** How do I Monitor Linux User Activity in real time?

**A.** The `whowatch` program scans the most current common log file of Linux server and creates the following statistics in real time:

- => The users currently logged on to the machine, in real-time.
- => User login name,
- => User tty
- => User host name
- => User's process
- => The type of the connection (ie. telnet or ssh)
- => Display of users command line can be switch to tty idle time.
- => Certain user can be selected and his processes tree may be viewed as well as tree of all system processes.
- => Kill user process etc

I have already written how to [install and configure whowatch](#). Please refer this previous <sup>[2]</sup> article.
