Shell script put multiple line comment

Posted by [Vivek Gite](#) <vivek@nixcraft.com>

Q. I'd like to use multiline comments under shell script. Under C / C++ I can use format

```
/*  
my c code  
comment # 2  
blah  
*/
```

[1]

How do I put multi line comment under a shell script?

A. By default shell script can be commented out prefixing # character for example:

```
# my comment  
For multilinecomment use  
# my comment 1  
# my comment 2  
# my comment N
```

However you can use HERE DOCUMENT feature as follows:

```
#!/bin/bash  
echo "Say Something"  
<<COMMENT1  
    your comment 1  
    comment 2  
    blah  
COMMENT1  
echo "Do something else"
```
