Linux ATI HD3750 Drive Configuration Hangs

Posted by Vivek Gite <vivek@nixcraft.com>

I'm not able to boot into GUI under Dell desktop system, which uses an an ATI HD3750 display card. The display only works with CLI and but when I type startx and get some sort of error or a black screen. How do I fix this issue?

There is no working proprietary or open source **Linux ATI HD3750** driver exits. All, you can do is set it to vesa and use it for basic GUI display purpose. Boot into a single user mode and open the following file:

[2]

[1]

```
cp /etc/X11/xorg.conf /etc/X11/xorg.conf.bak.dec.02
vi /etc/X11/xorg.conf
```

Make sure Device section is set as follows:

```
Section "Device"
    Identifier      "Device0"
    Driver          "vesa"
    VendorName      "ATI HD3750 vesa"
EndSection
```

OR

```
Section "Device"
        Identifier  "Videocard0"
        Driver      "vesa"
EndSection
```

Save and close the file. Reboot the desktop or just type startx:

```
$ startx
```
