Fedora Linux reconfigure X server

Posted by Vivek Gite <vivek@nixcraft.com>

Q. I messed up with my X server configuration. Now I would like to reconfigure X server.

A. Fedora comes with the X Configuration Tool called redhat-config-xfree86 which provides a graphical interface for creating, modifying or reconfiguring the XFree86 configuration file. [1]

At shell prompt type following command to reconfigure X server under Fedora Linux (login as the root user):

```
# redhat-config-xfree86
```

[2]

You can pass --reconfig option and --noui option if want to disregard any configurations on existing XFree86 configuration files. This is useful when your system is with no prior X configuration:

```
# redhat-config-xfree86 --reconfig --noui
```
