cPanel: Update Exim Mail Server

Posted by Vivek Gite <vivek@nixcraft.com>

Q. I'm using Cpanel CentOS Linux server. How do I upgrade my exim mail server? How do I update to the latest version of exim under cPanel Sever?

[1]

cPanel has special script located in /scripts/ directory to update almost all software it installs on the server. You can manually upgrade to the latest version of exim as follows:

Login into the server using ssh

Run the command:

```
/scripts/eximup
```
