Domain Redirection Using a PHP Script

Posted by Vivek Gite <vivek@nixcraft.com>

Q. How do I redirect my domain name using a php server side scripting under Apache web server? [1]

A. Under PHP you need to use header() to send a raw HTTP header. [2]

If you want to redirect a domain to some other URL, you can use the PHP script as below

```php
<?php
header [3] ("Location: http://example.com/");
exit [4] ();
?>
```

See PHP Redirect To Another URL / Page Script [5] FAQ for further information.
